

Project Title

Flutter SQLite Task Manager Application

Objective

Develop a Flutter application using SQLite that performs CRUD operations including storing, retrieving, updating, and deleting data.

Project Workflow

User enters task → Task stored in SQLite → Data retrieved → Displayed in UI → User updates/deletes → Database updates instantly.

Update/Edit Feature

The update feature allows users to modify an existing task. When a task is selected, its data is loaded into the input field. After editing, the updated data is saved using the `update()` method of the database helper class, which modifies the record based on its ID.

Database Structure

Database: tasks.db

Table: tasks

Fields: id (Primary Key), title (Text)

Screenshots Section

1. Home Screen – Displays list of tasks.
2. Add Task Screen – Input field to add new task.
3. Updated Task View – Shows modified task.
4. Delete Action – Removes task from list.

Note: Insert actual screenshots here before final submission.

Flow Diagram

Start → Open App → Enter Task → Save to SQLite → Fetch Data → Display List → Update/Delete Action → Update Database → Refresh UI → End

Conclusion

This project demonstrates local database handling in Flutter using SQLite with full CRUD functionality.
